Perioperative Hemodynamic Monitoring And Goal

This unique book provides clinicians and administrators with a comprehensive understanding of perioperative hemodynamic monitoring and goal directed therapy, emphasizing practical guidance for implementation at the bedside and evaluating hemodynamic monitoring systems in clinical practice.

Perioperative Hemodynamic Monitoring and Goal Directed ...

The fourth section (11 chapters) describes goal-directed haemodynamic optimization in the perioperative setting (including cardiac surgery), intensive care, emergency, and critical care settings. The various methods (fluid therapy, blood transfusion, and vasopressors), monitoring techniques, haemodynamic goals and the evidence for goal-directed therapy, the targets of goal-directed therapy, and the associated controversies are nicely covered in this section.

Cardiovascular Physiology Applied to the Perioperative and ...

Perioperative goal-directed haemodynamic therapy (GDT) is a protocolised treatment strategy aimed at optimisation of global cardiovascular dynamics, including oxygen delivery to tissues and organ perfusion pressure. This is achieved by titrating fluids, vasopressors, and inotropes to predefined physiological target values of haemodynamic variables.

The '5 Ts' of perioperative goal-directed haemodynamic ...

We analyzed in a randomized controlled trial whether a perioperative GDT based on noninvasive hemodynamic monitoring aiming at the optimization of arterial blood pressure and cardiac output is associated with a decrease in hospital length of stay (LOS) and the incidence of postoperative complications in major abdominal surgery patients requiring postoperative intensive care unit (ICU) admission compared with standard practice.

Perioperative management guided by appropriate sequential clinical evaluation combined with respiratory and hemodynamic monitoring is an established tool to help clinicians to identify those patients at higher risk in the attempt to reduce the complications rate and potentially improve patient outcomes.

Current concepts of perioperative monitoring in high-risk ...

Perioperative goal directed therapy is can improve postoperative outcome of intermediate-to-high-risk surgical patients. Based on current evidence it seems to be associated with decreased postoperative length of stay, number of complications and possibly even mortality.

Hemodynamic monitoring is the cornerstone of perioperative anesthetic monitoring. In the unconscious patient, hemodynamic monitoring not only provides information relating to cardiac output, volume status and ultimately tissue perfusion, but also indicates depth of anesthesia and adequacy of pain control.

GDT was defined as perioperative monitoring and manipulation of hemodynamic parameters to reach normal or supranormal values by fluids alone or with inotropes. Trials comparing the effects of GDT and standard hemodynamic therapy were considered. Primary outcome was acute kidney injury, whichever definition was used.
